

WSIL

INTEGRAZIONE DATI SUL WEB

ANNO 2016-2017

Dario Di Pasquale
Mattia Tomeo
Fabio Napoli

PROBLEMA

PROBLEMA(1)

- Cerchi una **guida rapida** che ti aiuti a scegliere un nuovo linguaggio di programmazione, un suo framework o una particolare tecnologia, da apprendere?
- Ogni anno vengono sviluppati nuovi linguaggi di programmazione o framework!

PROBLEMA(2)

- Spesso alcuni linguaggi nascono e muoiono in poco tempo
- I programmatori devono mantenersi costantemente aggiornati per rispondere alle esigenze di mercato

PERCHÉ PERDERSI IN UN DEDALO DI TECNOLOGIE???

SOLUZIONE

WHAT SHOULD I LEARN

WSIL

COS'È

COS'È (1)

- Recuperare informazioni su un linguaggio di programmazione può essere tedioso, dovendo consultare molti siti e piattaforme differenti

COS'È(2)

‘’ **WSIL** è una piattaforma che permette di ricavare informazioni e statistiche utili relativamente alla popolarità dei linguaggi di programmazione e dei framework’’

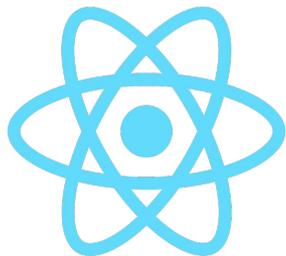

COS'È(3)

‘’Permette inoltre di trovare offerte di lavoro e corsi online per essi, attingendo da più fonti’’

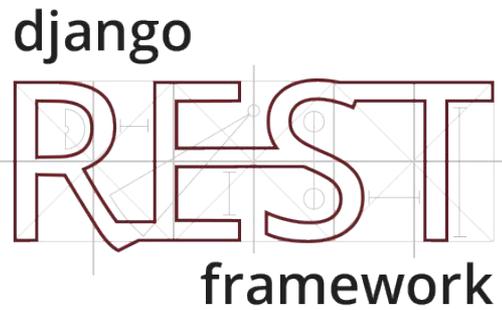

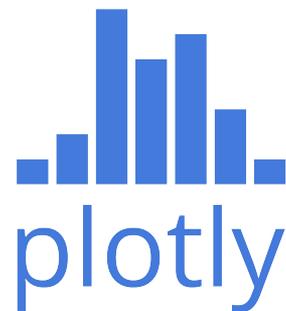

TECNOLOGIE
UTILIZZATE

TECNOLOGIE UTILIZZATE

django

DEMO

LE FONTI

LE FONTI(1)

GitHub

StackOverflow

LE FONTI(2)

Wikipedia

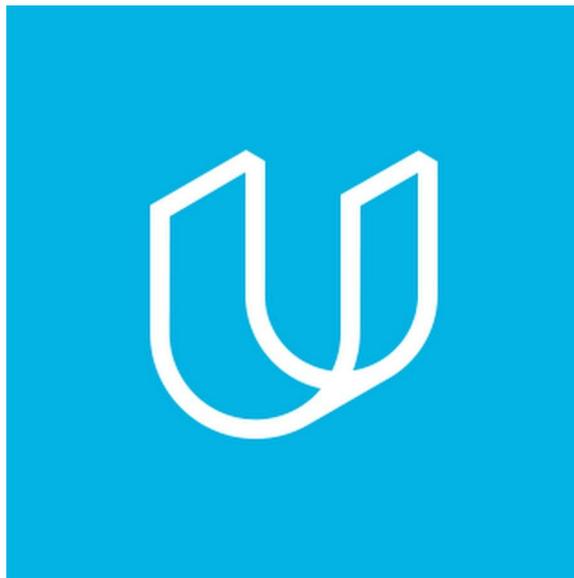

WIKIPEDIA
The Free Encyclopedia

Google Trends

LE FONTI(3)

Udacity

Coursera

LE FONTI(4)

Authentic Jobs

Indeed

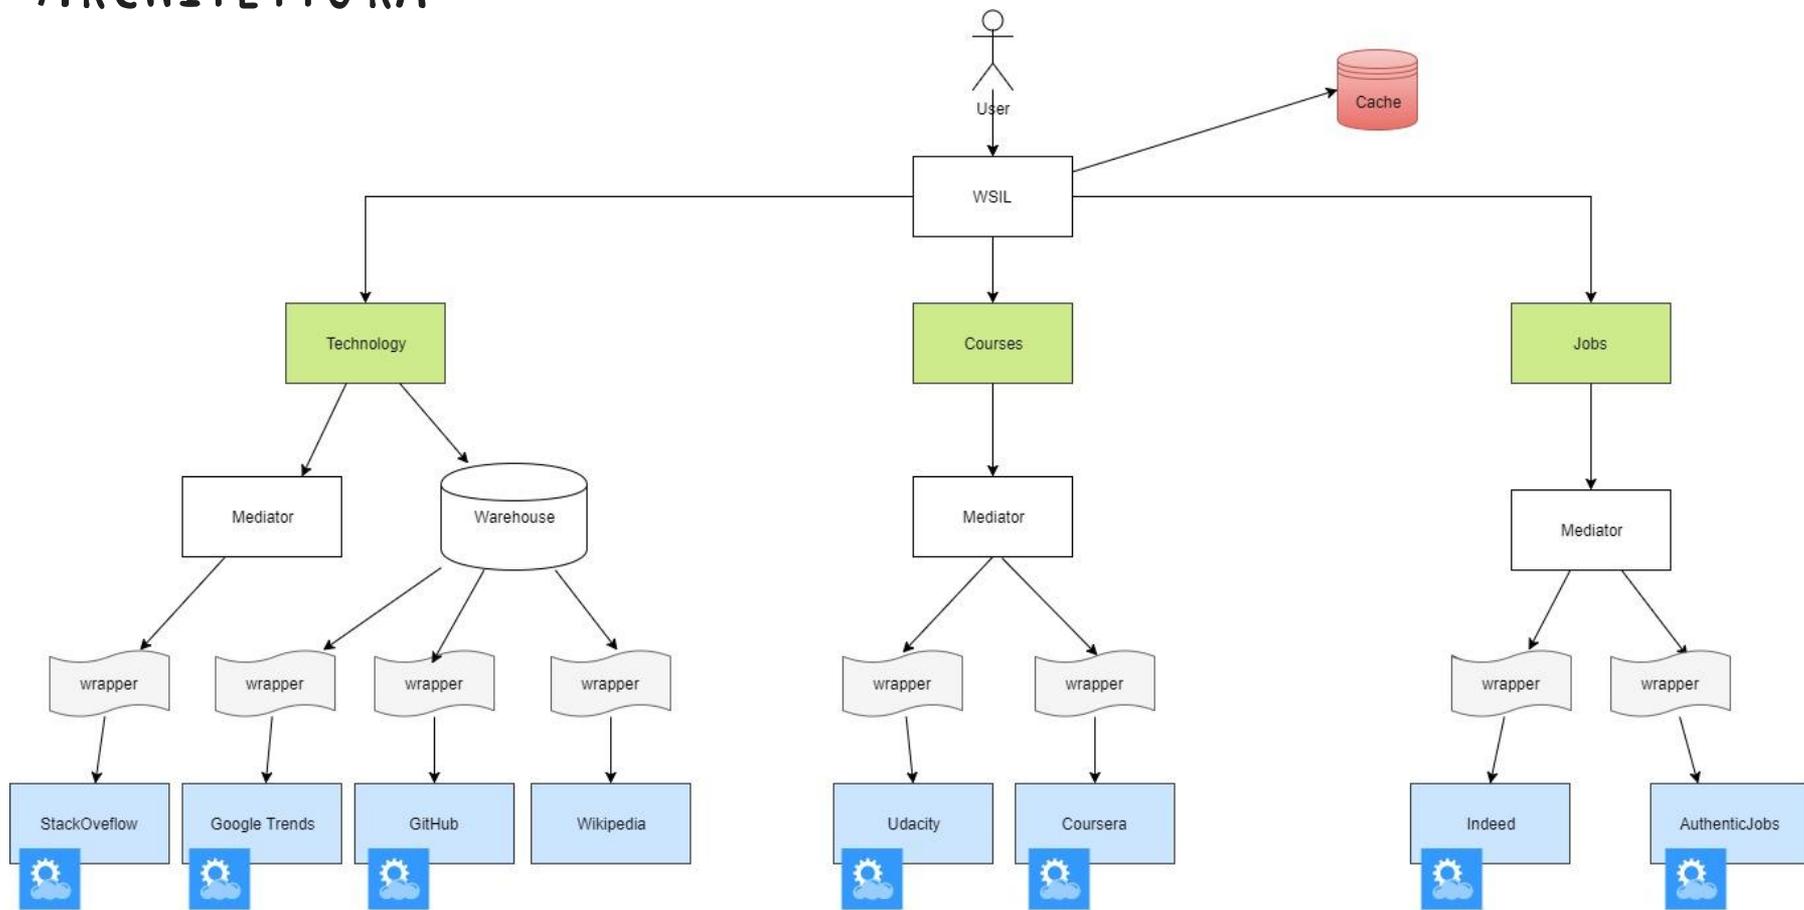

LE FONTI(5)

LA VOLATILITÀ

	GitHub	Stack Overflow	Wikipedia	Google Trends	Udacity	Coursera	Authentic Jobs	Indeed
Tipologia	Database	API	WEB PAGE	API	API	API	API	API
Volatilità	MEDIA	ALTA	BASSA	MEDIA	BASSA	BASSA	ALTA	ALTA

ARCHITETTURA

ARCHITETTURA

CACHE

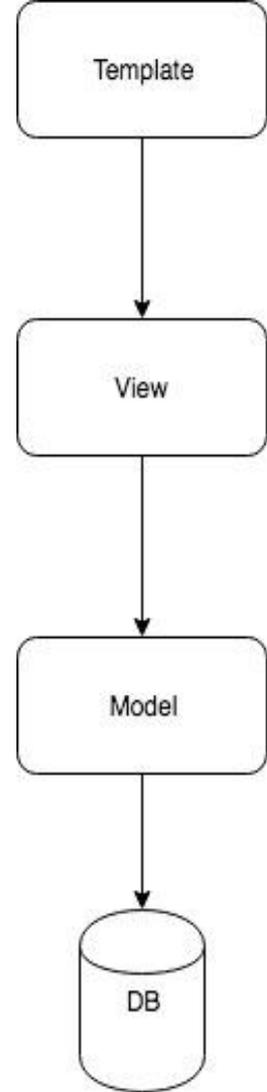

QUERYING

I **model** di Django rappresentano lo schema globale;

L'accesso allo schema locale avviene tramite opportuni metodi codificati nei model;

Abbiamo due tipi di query:

- query per keyword;
- query su tutto il database.

QUERY PER KEYWORD

Coursera

Indeed

Authentic Jobs

In questo caso viene generata la richiesta utilizzando il nome del linguaggio o del framework della quale si vogliono recuperare le informazioni

QUERY DI TUTTO IL DB

Udacity

Vengono scaricati tutti i corsi e inseriti nella cache. Quelli aventi la parola chiave nella descrizione vengono restituiti dalla query.

JOINT FONTE

JOINT FONTI(1)

- RICERCA DELL'INTERESSE NEL TEMPO DI UN LINGUAGGIO
- RICERCA DELL'INTERESSE NEL TEMPO DI UN FRAMEWORK
- RICERCA DELL'INTERESSE PER REGIONE DI UN LINGUAGGIO
- RICERCA DELL'INTERESSE PER REGIONE DI UN FRAMEWORK
- RICERCA DEI PARTNER DEI CORSI

JOINT FONTI(2)

- RICERCA DELL'INTERESSE NEL TEMPO DI UN LINGUAGGIO

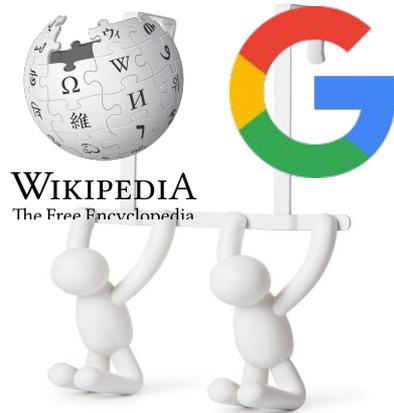

Si cerca prima il nome del linguaggio all'interno della fonte S1(GitHub) per poi ricavare il grado di interesse nella fonte S4(Google Trends)

JOINT FONTI(3)

- RICERCA DELL'INTERESSE NEL TEMPO DI UN FRAMEWORK

Si cerca prima il nome del framework all'interno della fonte S3(Wikipedia) per poi ricavare il grado di interesse dalla fonte S4(Google Trends)

JOINT FONTI(4)

- RICERCA DELL'INTERESSE PER REGIONE DI UN LINGUAGGIO

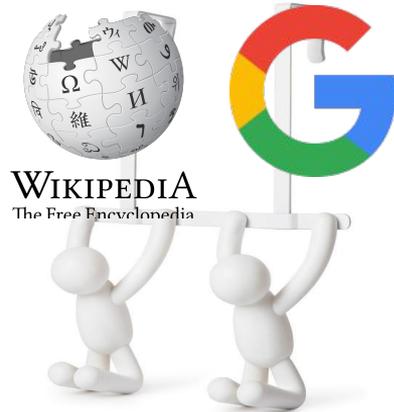

Si cerca prima il nome del linguaggio all'interno della fonte S1(GitHub) per poi ricavare il grado di interesse dalla fonte S4(Google Trends)

JOINT FONTI(5)

- RICERCA DELL'INTERESSE PER REGIONE DI UN FRAMEWORK

Si cerca prima il nome del framework all'interno della fonte S3(Wikipedia) per poi ricavare il grado di interesse dalla fonte S4(Google Trends)

JOINT FONTI(6)

- RICERCA DEI PARTNER DEI CORSI

Dato il nome di un partner prelevato dalla fonte S5(Udacity), viene verificata la sua presenza nella fonte S6(Coursera) in modo da non avere due occorrenze replicate.

SCHEMI LOCALI

SCHEMI LOCALI (S1, S2)

- **S1.language(?language_name, ?numberRepo)**
- **S2.tag(?tag_name, count)**

SCHEMI LOCALI (S3)

WIKIPEDIA
The Free Encyclopedia

- **S3.library_framework(name,type,origin_author,developers,initial_release,stable_release,repository,development_status,language_used,license,website,description)**
- **S3.feature(?library_framework_name, ?ajax, ?mvc_framework, ?mvc_push_pull, ?localization, ?orm, ?testing_framework, ?db_migration_framework, ?security_framework, ?template_framework, ?caching_framework, ?form_validation_frameworks)**

SCHEMI LOCALI (S4)

- **S4.interest_over_time(?keyword, ?date, ?interest_rate)**
- **S4.interest_by_region(?keyword, ?region, ?interest_rate)**

SCHEMI LOCALI (S5, S6)

- `S5.course(?course_id, ?slug, ?course_type, ?logo, ?photo_url, ?description, ?workload, ?url)`
- `S5.affiliates(?course_key, ?name, ?image)`
- `S6.course(?course_id, ?slug, ?course_type, ?logo, ?photo_url, ?description, ?workload, ?url)`
- `s6.partner(?partner_id, ?partner_name)`
- `S6.partnership(?course_id, ?partner_id)`

SCHEMI LOCALI (S7, S8)

Authentic[®]

- `S7.job(?job_title, ?description, ?post_date, ?company_name, ?company_url, ?location_name, ?lat, ?lng, ?keywords)`
- `S8.result(?job_title, ?description, ?post_date, ?company_name, ?company_url, ?location_name, ?lat, ?lon, ?query).`

WRAPPERS

WRAPPER (UDACITY)

Endpoint: <https://www.udacity.com/public-api/v0/courses>

Ts=(key, title, homepage, subtitle, level, starter, image, banner_image, teaser_video, summary, short_summary, required_knowledge, expected_learning, featured, syllabus, faq, full_course_available, expected_duration, expected_duration_unit, new_release, tracks, affiliates, instructors, affiliatesName, affiliatesImage)

Tw=course(?course_id, ?slug, ?course_type, ?course_name, ?logo, ?photo_url, ?description, ?workload, ?url), affiliates(?course_key, ?name, ?image)

WRAPPER (AUTHENTIC JOBS)

Endpoint:

`https://authenticjobs.com/api?api_key=<API_KEY>&method=aj.jobs.search&keywords=<SEARCH_STRING>`

Ts=(id, title, description, perks, howToApply, postDate, relocation_assistance, telecommuting, keywords, applyurl, url, categoryID, category,Name,categoryType,categoryLogo,categoryTagline,category, locationID, locationName, locationCity, locationCountry, locationLatitude, locationLongitude, locationState)

Tw=job(?job_title, ?description, ?post_date, ?company_id, ?location_id, ?keywords), company(?company_id, ?company_name, ?company_url), location(?location_id, ?location_nam, ?lat, ?lng)

WRAPPER (INDEED)

Endpoint:

`http://api.indeed.com/ads/apisearch?publisher=<PUBLISHER_ID>&q=<SEARCH_STRING>&v=<VERSION_NUMBER_API>&latlong=1`

Ts=(query,jobTitle, company, city, state, country, language, formattedLocation, source, date, snippet, url, jobKey, sponsored, station, expired, indeedApply,latitude, longitude)

Tw=(jobTitle, company, description, location, postDate,company_name, ?company_url url, lat, lon,query)

WRAPPER (COURSEERA)

Endpoint:

https://api.coursera.org/api/courses.v1?q=search&query=<SEARCH_STRING>

Ts=(id, slug, name, primaryLanguages, subtitleLanguages, partnerLogo, instructors, partnerIds, photoUrl, certificates, description, startDate, workload, previewLink, specializations)

Tw=(course_id, slug, course_type, course_name, logo, photo_url, description, workload, url)

WRAPPER (COURSEERA PARTNER)

Endpoint:

`https://api.coursera.org/api/partners.v1/:course_id/includes=partnerIds`

Ts=(id, name, shortName, description, banner, courseIds, instructorIds, links, location)

Tw=partner(partner_id, partner_name), partnership(partner_id, course_id)

WRAPPER (STACKOVERFLOW)

Endpoint:

`https://api.stackexchange.com/2.2/tags?order=desc&sort=popular&inname=<keyword>&site=stackoverflow`

`Ts=(has_synonyms, is_moderator_only, is_required, count, name)`

`Tw=tag(name, count)`

WRAPPER (GOOGLE TRENDS)

Usiamo la libreria **Pytrends** grazie ai seguenti metodi:

```
TrendReq(GOOGLE_USR, GOOGLE_PWD), build_payload(kw_list),  
pytrends.interest_over_time(), pytrends.interest_by_region()
```

Interest over time

```
Ts = Tw=(keyword, interval, interest_rate)
```

Interest by region

```
Ts = Tw = (keyword, region, interest_rate)
```

WRAPPER (GITHUB)

- Si utilizza **GitArchive**
- I dati messi a disposizione da GitHub Archive sono accessibili scaricando il file
<http://data.githubarchive.org/YYYY-MM-DD-HH.json.gz>;
- I dati vengono filtrati e da questi vengono ricavate delle statistiche;
- I risultati dell'elaborazione vengono salvati nel database.

WRAPPER (GITHUB)(2)

- **Ts**=language(language_name, repo_count)
- **Tw** = RepositoryUsingIt(language_name, repo_count),
Language(language_name).

WRAPPER (WIKIPEDIA)

Link: https://en.wikipedia.org/wiki/Comparison_of_web_frameworks

- **library_framework:**

XPATH: `//*[@id="mw-content-text"]/div/table[position()<18 and position()>2]/tr[position()>1]`

XPATH: `./../preceding-sibling::h3[1]/span/text()`

Ts1 = (name, stable_release, release_date, license, language_used)

WRAPPER (WIKIPEDIA)

link pagina del framework/libreria

XPATH: `//*[@id="mw-content-text"]/div/table[position() <18]/tr/th/a@href`

XPATH: `//*[@id="mw-content-text"]/div/table[position()<=3]/tr`

Ts2 = (initial_release, repository, development_status, type, license, website)

XPATH: `//*[@id="mw-content-text"]/div/p[1] |//*[@id="mw-content-text"]/p[1]`

Ts3 = (description).

Tw = library_framework(name, type, initial_release, stable_release, repository, development_status, language_used, license, website, description)

WRAPPER (WIKIPEDIA)

- **features**

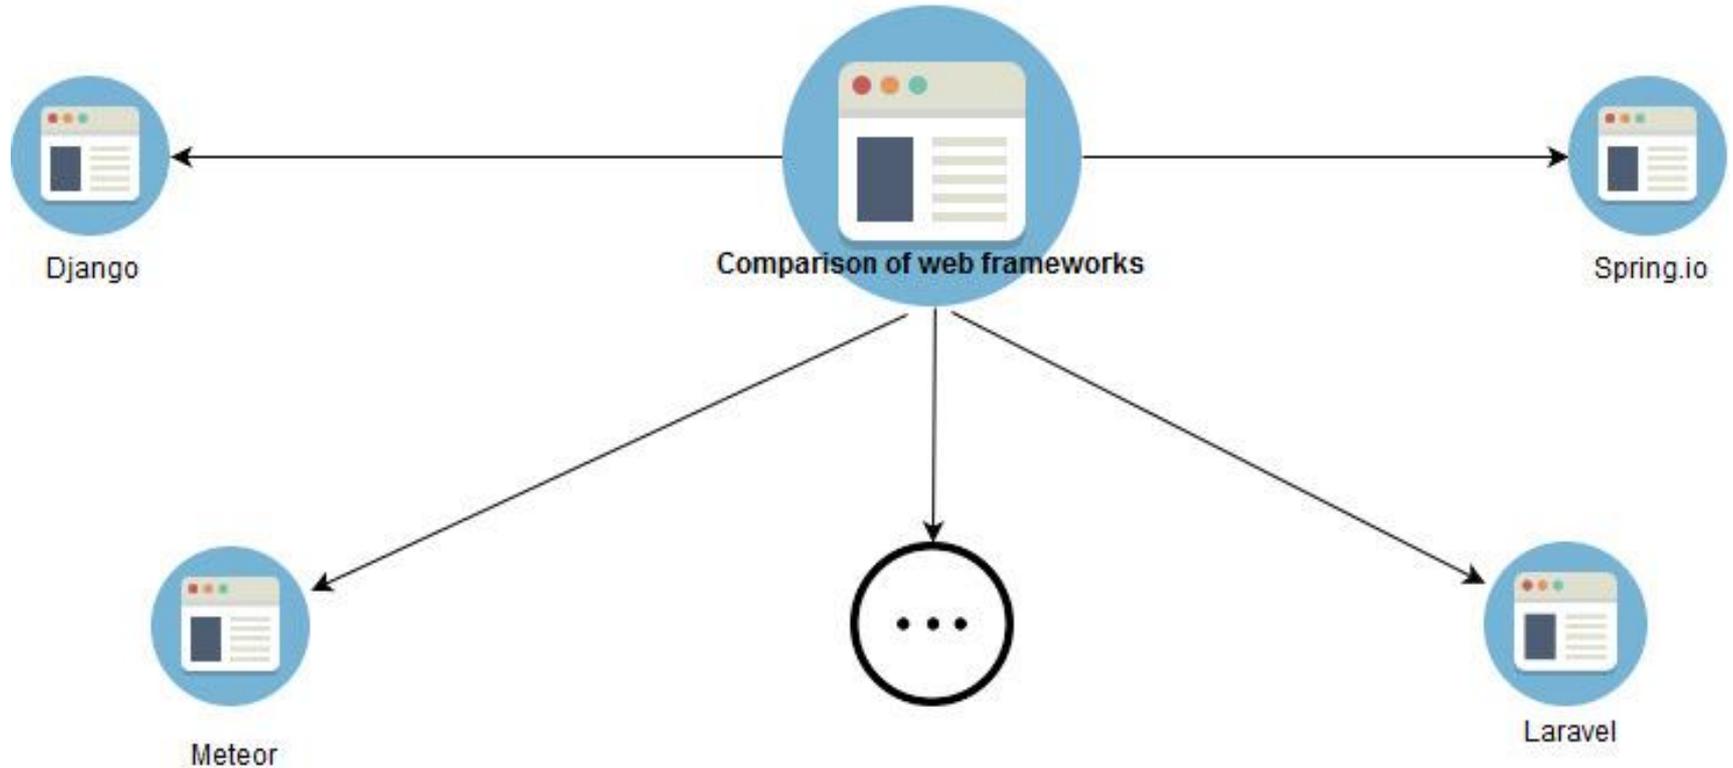

Ts = (library_framework_name, ajax, mvc_framework, mvc_push_pull, localization, orm, testing_framework, db_migration_framework, security_framework, template_framework, caching_framework, form_validation_frameworks).

XPATH: `//*[@id="mw-content-text"]/div/table[position() >= 18]/tr`

Tw = Ts

WRAPPER (WIKIPEDIA)

```
//*[@id="mw-content-text"]/div/table[position() < 18]/tbody/tr/th/a@href
```

SCHEMA GLOBALE

SCHEMA GLOBALE(1)
